

Mobile responsive and Positions

Assignment

1.What is position property in CSS and its type?

The CSS position property defines the position of an element in a document. This property works with the left, right, top, bottom and z-index properties to determine the final position of an element on a page.

2.How any types of positioning are there in CSS?

There are several types of positioning: static, relative, absolute, fixed, sticky, initial and inherit. Static - this is the default value, all elements are in order as they appear in the document.

3.What is Z-index and why to use it?

z-index is the CSS property that controls the stacking order of overlapping elements on a page. An element with a higher z-index value will appear in front of an element with a lower z-index value. The property is called “z-index” because it sets the order of elements along the z-axis.
